What is Application Data Sets (ADS)?

- Application Data Sets (ADS) is the name given to a collection of technology used to migrate application/configuration data between PeopleSoft environments
- Application Data Sets is used as part of the Selective Adoption maintenance process and can also be used between two different PeopleSoft applications that have similar data structures
- The parts that make up ADS are:
 - Application Data Set Definitions and the Data Set Designer
 - ADS Projects
 - Data Migration Workbench

ADS Flow – Data Migration Workbench

Advantages

- Enable a simple UI for defining business objects consisting of tightly coupled data.
- Allow groups of logically related business objects to be copied and compared following the managed object project paradigm.
- Make the Managed Object functionality easily available to a wider sets of application data.
- Extend existing managed object metadata.
- Perform copies and compares on servers rather than workstations for better performance and efficiency.

Advantages

- Provide a compare facility for data currently moved by Data Mover.
- Provide better control of changes via an approval governance using the Approval Framework.
- Reduce errors with a validation framework that performs common validations out of the box and allows custom validations to be expressed in PeopleCode.
- Eliminate manually copying project files by providing a shared project file repository.

ADS is used to Migrate

PeopleTools Examples

- WorkCenters
- Related Content
- Pivot Grids
- Activity Guides
- Dashboards
- Pagelets

Application Examples:

Global Payroll

Data Set and Data Set Instance

Hierarchy of records with some collective properties

Data Set

Data content representing a unit of work

Data Set Instance

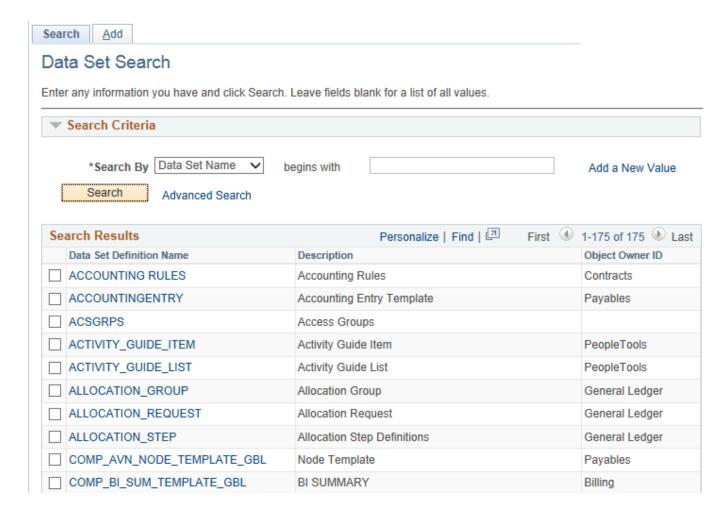

Data Set

A data set definition defines the shape of the data set instances.

- A root record. The primary keys of the root record are then keys of the data set instance
- An optional hierarchy of related child records, where each child record includes the keys of its parent record.
- An optional set of properties.
- An optional set of relationships to other data sets, and their properties.
- An optional set of attribute groups and their properties.
- An optional application class having PeopleCode that controls the behavior of the data set instances at copy, compare and validate time.

ADS Projects

ADS projects provide the ability to move, compare, validate, and merge configuration data.

Configuration data includes:

- Setup data
- Application data
- Tools configuration
- Managed objects

Data Migration Workbench facilitates the configuration management process by providing the interactive user interface.

Insert Data Set Content

This page allows users to identify and insert instances of data into the project. Users can limit the scope of the result set by entering and refining search criteria.

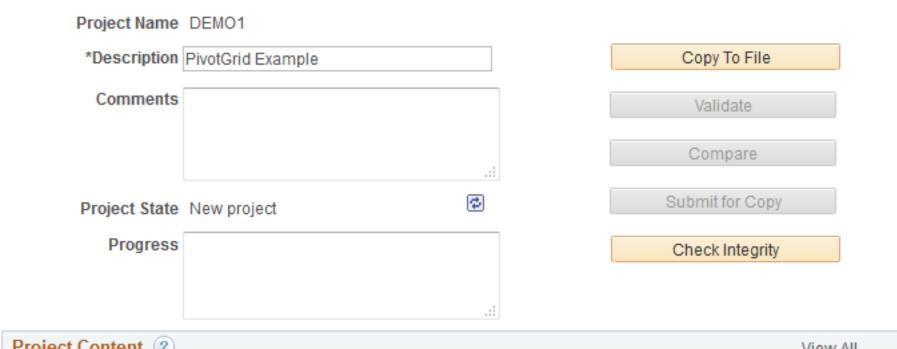

This is not a slide – but the online demo Message

Message

2 instances of PIVOTGRID_DEFINITION and 1 instances of related data sets inserted into the project (257,940)

The number of instances inserted into the project reflects only instances not in the project at the time of insert.

creat consecut princip

Data Migration Workbench

With it you can . . .

- Create a new ADS project on the source database containing specific data set instances
- Compare the ADS project to the target database
- View and analyze the compare reports
- Override copy or merge action as necessary
- Copy the project from file to the target database

ADS Topics

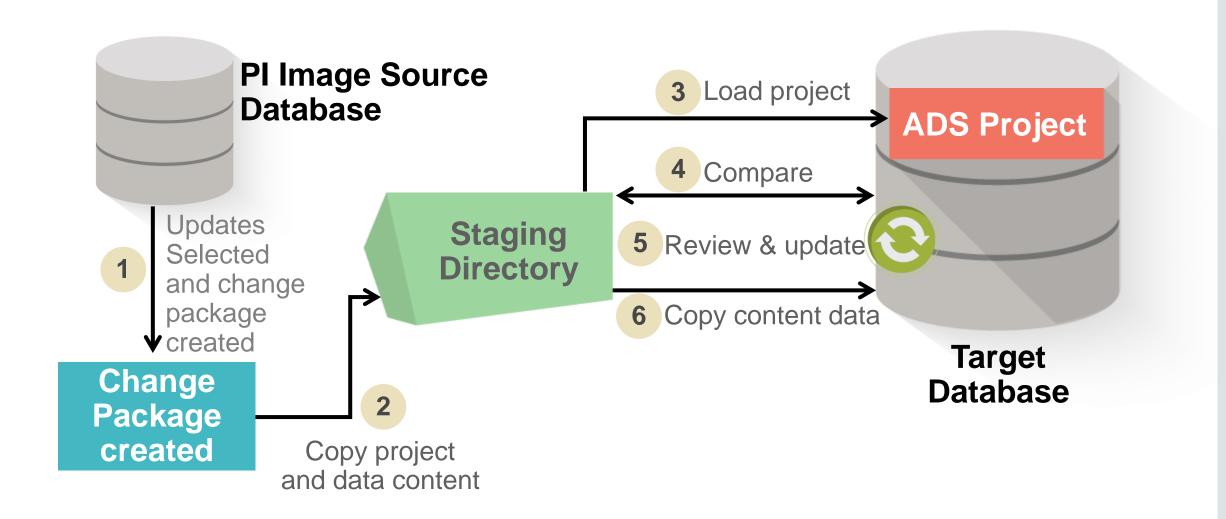

- Application Data Set Overview
- Understanding Data Set Designer
- Using Data Migration Workbench
- ADS and PeopleSoft Update Manager
- Best Practices
- Additional Information

ADS and PeopleSoft Update Manager

- Configuration data is delivered as an ADS project
- If there are multiple ADS projects in the selected updates, they will be combined into one project to optimize performance and simplify the update process
- Steps for ADS projects are created in the Change Assistant template

PeopleSoft Roles

- PeopleSoft data owners
 Create data set definitions
- PeopleSoft development
 Incorporate ADS projects in updates delivered in PUM

Customer Roles

PUM users

Use the Data Migration Workbench to review compare reports and update ADS projects as necessary.

Use the filters in Data Migration Workbench to narrow down the search results.

Developers

Use delivered data sets to migrate content data.

Use Data Set Designer to create data sets for custom definitions.

Use Data Migration Workbench to create, compare and copy custom definitions.

Reviewers

If Approval Framework is implemented reviewers will approve the Copy from File before the data is copied into the target database.
