Introduction	4
Access and Considerations	5
Prerequisites	6
Running of Terraform Scripts	9
Terraform Script Execution Part-1 (Run Script via Home Region)	9
OpenShift Image Preparation	9
Terraform Script Execution Part-2 (Run Script via C3 Region)	12
Install the Cluster using the Redhat Assisted Installer UI	15

Introduction

In today's changing world of business IT, automation and native solutions play a crucial role in ensuring flexibility, scalability and effectiveness. As more companies embrace various Kubernetes platform as OpenShift for managing containers, the importance of deployment processes becomes clear. This guide helps to address the specific preference of using Redhat's OpenShift for Kubernetes by offering a step-by-step instructions of installing OpenShift on Compute Cloud@Customer.

OpenShift offers a variety of features, including automated installation, upgrades, and life cycle management. It also provides advanced security and monitoring, integrated storage, and CI/CD pipeline management. OpenShift is powered by Kubernetes, an open-source project that streamlines the entire application lifecycle, from development to delivery to management

This content is provided for informational purposes and self-supported guidance only. Consultancy or other assistance related to the content is not covered under the Oracle Support contract or associated service requests. If you have questions or additional needs, then please do reach out to your Oracle Sales contact directly.

Access and Considerations

Before getting into the steps for setting up OpenShift on Oracle Compute Cloud@Customer, it's important to make sure you have all the necessary prerequisites ready. This section outlines the elements needed to carry out the installation with minimal disruptions.

The prerequisites covered in this document encompass operational aspects, including:

- **Access to Compute Cloud@Customer:** Make sure you have an active account with the appropriate permissions to create and manage resources on Oracle Compute Cloud@Customer.
- **Access to Oracle Cloud Infrastructure Region Tenancy:** Make sure you have an active account in the OCI Region's Tenancy that will be connected to Compute Cloud@Customer using a Federated Identity Provider. This OCI Tenancy will be used to manage and maintain all IAM Services for Compute Cloud@Customer.
- **Access to Redhat Assisted Installer Clusters Portal:** During the step-by-step deployment process, you will be taking advantage of the Redhat Hybrid Cloud Console Portal:
<https://console.redhat.com/openshift/assisted-installer/clusters>
- **Access Credentials:** You will need a bastion / jump host within your C3 target Compartment's Tenancy to connect with an external Terraform website to download and install Terraform. You will also use this Bastion host for OCI CLI, Running the Terraform Scripts and preparing the OpenShift Clusters.
- **Networking Considerations:** Ensure that your network setup allows for communication, which includes setting up VCN (Virtual Cloud Network) configuring subnets and managing security lists. If your C3 is disconnected, you will need to access external networks via a DRG.
- **Infrastructure Planning:** Develop a strategy outlining the resources needed capacity projections and design aspects customized to suit your organizations requirements.

By fulfilling these criteria, you will be ready to follow the instructions outlined in this paper guaranteeing a seamless and effective deployment of your Redhat OpenShift Clusters on Oracle Compute Cloud@Customer.

Bastion Configuration

A Bastion Host, also referred to as a jump server, provides a server created to enable access to a private network from an external network, like the internet. For the OpenShift deployment on Oracle Compute Cloud@Customer, a bastion host is utilized to host Terraform scripts utilized to configure infrastructure and build OpenShift Clusters. It will also be utilized for reaching resources and instances within a subnet in your Compute Cloud@Customer environment.

Advantages of Using a Bastion Host are:

- **Access Point:** Acts as an entry point for administrators and users to connect to instances in the private network without exposing them directly to the internet.
- **Offers a controlled gateway** thereby reducing the vulnerability surface.
- **Isolation of Critical Resources:** Ensures that computing resources within the network are safeguarded and isolated from internet exposure. Helps in minimizing risks associated with attacks on systems.
- **Monitoring:** Centralizes access logging simplifying tracking and auditing access to resources. Can be integrated with security information and event management (SIEM) systems, for monitoring capabilities.

By implementing a bastion host, you can securely and efficiently manage access to your Oracle Compute Cloud@Customer or Private Cloud Appliance resources, ensuring that your private instances remain protected and accessible only through a secure, controlled entry point.

The installation of the OCI CLI will be revisited in the first section of this procedure:

1. Install OCI CLI in your bastion host. For the step-by-step and how to install OCI CLI and properly setup the OCI CLI configuration file in your instance, refer to the following links below:
<https://docs.oracle.com/en-us/iaas/Content/API/SDKDocs/cliinstall.htm> and
<https://docs.oracle.com/en/engineered-systems/private-cloud-appliance/3.0-latest/user/user-usr-ce-cli.html#usr-cli-obtain-cabundle>.

Overview

The installation process outlined below will involve building two hosts within the targeted compartment of the OpenShift Cluster installation.

The first instance to be installed will be a “bastion” host, within the designated compartment, and will be used to run two Terraform scripts. The first script will be used for building IAM Resources on your OCI Home Region of the C3 (2 Dynamic Groups & 1 Policy). The second Terraform Script will be for building the Infrastructure Resources on the C3 System to support the OpenShift Cluster (the OpenShift VCN, Public and Private Subnets, Load Balancers, Internet GW, NAT GW, and DNS Server). It will include all the resources needed to allow the Control Plane and Worker Nodes to function that form a cluster. The bastion will be installed in the designated OpenShift Compartment and must be configured to communicate through a designated C3 DRG Subnet or Internet GW Subnet within the C3’s parent tenancy.

Finally, three Control Plane Nodes and three Worker Nodes will be provisioned, along with configuring the external and internal Load Balancers that form the Cluster.

Bastion Server - Prerequisites

In preparation to running Terraform Scripts, this section will be focused on the installation of Terraform and OCI CLI.

Currently Compute Cloud@Customer (C3) does not support OCI Resource Manager Stack (RMS). To run the Terraform script, a Bastion Server will be installed on the within the targeted OpenShift Cluster deployment. Terraform and OCI CLI will then be loaded on to the Bastion Server for execution.

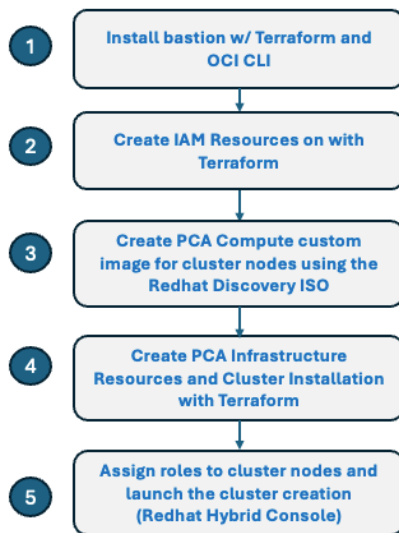

Public IP Addresses: You will need a set of 3 Public IP Addresses. Use of CIDR notations will provide ample number of IP Addresses

Note: Your Compute Cloud at Customer (C3) is Federated with an OCI Home Region (such as PHX, FRA, IAD, etc). The Compute Cloud@Customer inherits IAM Policies from this OCI Home Region. Configurations will include referencing this OCI Home Region and your C3 System. It is important to work from the OCI Home Region that your C3 is connected to. You will need Tenancy level permissions to create a specific Compartment to deploy OpenShift **and** to Create Dynamic Groups in your Home Region’s Tenancy.

The following is an overview of installations and directories that will be placed on to the bastion host for the execution of Terraform scripts. Before running the Terraform scripts, Terraform and oci-cli will be installed and configured.

The following figure, provides and overview of the installation process.

Installation Overview – Assisted Installer

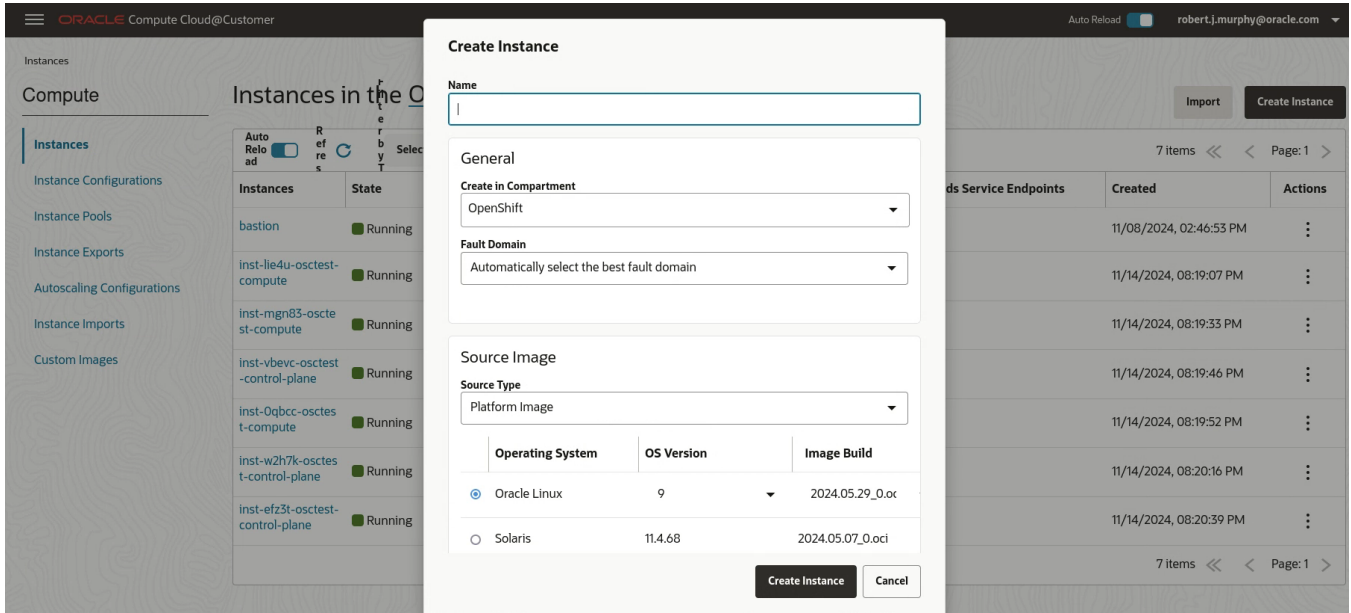

- **Currently C3/PCA does not support: Developer Services, Resource Manager**
- **The current procedure includes manual steps to set up running terraform scripts within target the compartment**
- **(1) Install an Instance bastion server** within Target Compartment & Install OCI CLI and Terraform
 - A preloaded custom image will be available w/ both
- **(2) Run Script-1** : Create IAM Resources – Dynamic Groups and Policies to allow instances to manage resources
- **(3) Create Discovery ISO on Red Hat OpenShift Portal**: Download customize Discovery ISO to PCA for Automated Install in Script-2
 - Includes adding customized Manifests, CSI and CCM Files
- **(4) Run Script-2**: Create Infra Resources (VCN, LB's, IGW, NAT, Etc) and Launch typical 3 x 3 Cluster (3 CP Nodes / 3 Worker Nodes)
 - Topology is shown on next page
- **(5) Assign Roles / Cluster Creation**: Assign roles, upload manifests & create cluster via Red Hat Assisted Installer Portal
- **(6) Launch OpenShift Console & Advanced Cluster Manager**

Figure-1

Bastion Installation

1. Create a Compartment in your OCI Home Region that will be managing this deployment. Allow a few minutes for this to propagate to your C3 system.
2. Login to the C3 System's Console
3. Click on "Compute" and switch to the Compartment made in Step-1
4. Create an Instance
 - a. **Name**: Provide a name of your choosing (for the remaining of this procedure, we will refer to this as "bastion")
 - b. **Create in Compartment**: Choose the Compartment used to build your Cluster
 - c. **Fault Domain**: Automatically select ...
 - d. **Source Image**: Oracle Linux 9
 - e. **Shape**: VM.Standard.E5.Flex
 - f. **OCPUs**: 2
 - g. **Memory (GBs)**: 20
 - h. **Subnet**:
 1. For disconnected C3's, the VCN and Subnet chosen for VNIC attachment must have a DRG for external access
 2. Choose an appropriate **VCN** and **Subnet** for external access if you are using a DRG.
 1. Alternatively, choose a Public Subnet with IGW Access
 - i. **Public IP**:
 1. Deselect for using DRG based install
 2. Select if using connected C3 and use of Public Subnet w/ IGW
 - j. **Private IP**:
 1. Keep (Optional)
 - k. **SSH Key**: Upload or Cut and Paste the Public Key into the dialogue box
 - l. **Create the Instance**

m. **Record the Private IP** – You will be using this to SSH into in the next step.

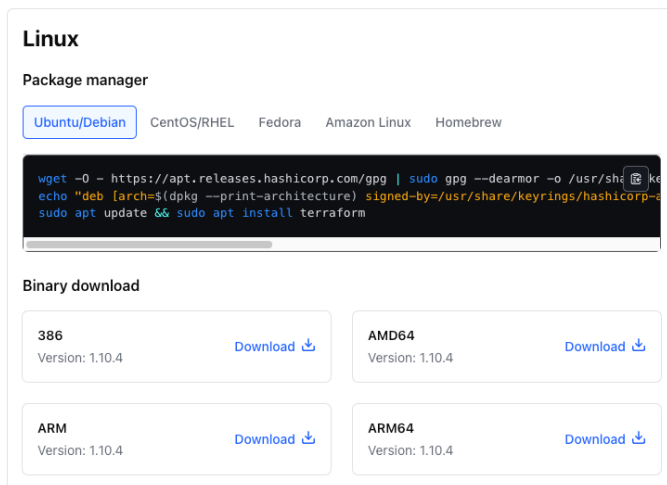

5. SSH into the **bastion** Instance using the Public or Private IP Address (if a DRG is utilized):
 - a. `[my_laptop ~]$ ssh opc@<bastion_IP_Address>`

Terraform Installation

1. Download the Terraform binary AMD64 zip file onto your laptop from: <https://developer.hashicorp.com/terraform/install>

Note: The Terraform binary version will continue to be updated. Choose the latest version.

2. SSH into your bastion instance
 - a. `[user@my_laptop ~]$ ssh opc@<bastion_private_IP_address>`
3. On the bastion instance, make a directory “prerequisite”

- a. [bastion ~]\$ mkdir /home/opc/prerequisite/
4. Transfer the Terraform zip file from your laptop to the bastion host via secure copy, scp:
 - a. [user@ my_laptop ~]\$ scp terraform_1.8.3_linux_amd64.zip
opc@<bastion_private_IP_address>:/home/opc/prerequisite/
5. Unzip the Terraform Binary and move it to the **bin** directory
 - a. [opc@bastion ~ ./prerequisite]\$ unzip terraform_1.8.3_linux_amd64.zip
 - b. [opc@bastion ~ ./prerequisite]\$ sudo mv terraform /usr/local/bin
 - c. [opc@bastion ~ ./prerequisite]\$ sudo chmod +x /usr/local/bin/terraform
 - d. Verify the Terraform installation was a success.
 1. [opc@bastion ~ ./prerequisite]\$ terraform version
 2. The processor type and version number will be returned

Installing and Configuring OCI CLI

1. Install the OCI CLI

- a. Goto: [Offline Installation documentation](#)
 1. **Choose:** Choose an “Oracle Linux 9 Offline” version
 2. **Example:** oci-cli-3.49.2-Oracle-Linux-9-Offline
- b. Download the zip file to your local machine
- c. Transfer from the file from your local machine to the targeted bastion server and store in the prerequisite folder:
 1. [user@my_laptop ~]\$ scp oci-cli-3.49.2-Oracle-Linux-9-Offline.zip
opc@<bastion_private_IP_address>:/home/opc/prerequisite/
- d. SSH into the bastion the bastion server
 1. [user@my_laptop ~]\$ ssh opc@<bastion_private_IP_address>
- e. Unzip the oci cli file:
 1. [opc@bastion ~ ./prerequisite]\$ unzip oci-cli-3.49.2-Oracle-Linux-9-Offline.zip
- f. Install oci cli
 1. [opc@bastion ~ ./prerequisite/]\$ cd oci-cli-installation
 2. [opc@bastion ~ ./prerequisite/oci-cli-installation]\$ bash install.sh --offline-install
 1. Answer **no** to any changes regarding paths and defaults presented (**leave blank**)

2. Configure the OCI CLI

- a. [opc@bastion ~]\$ oci setup config
- b. [opc@bastion ~]\$ **Enter a location for your config [/home/opc/.oci/config]:** Enter (keep path)
- c. [opc@bastion ~]\$ **Enter a user OCID:** Els
- d. nter your User OCID (Goto your C3 Console of your Home OCI Console, navigate to you Identity and obtain your OCID)
- e. [opc@bastion ~]\$ **Enter your Tenancy OCID:** Enter your Tenancy OCID (This can be found on the OCI Home Console in the upper right corner, Profile.)
- f. [opc@bastion ~]\$ **Enter a Region by index or name:** Select the Region name’s representative number and enter it (for this example, we are using us-ashburn-1)
- g. [opc@bastion ~]\$ **Do you want to generate a new API Signing RSA key pair?** Y
- h. [opc@bastion ~]\$ **Enter a directory for your keys to be created [/home/opc/.oci]:** Enter (keep default)
- i. [opc@bastion ~]\$ **Enter a name for your key [oci_api_key]:** Enter (keep default)
- j. [opc@bastion ~]\$ **Enter a passphrase for your private key:** select N/A (or choose a passphrase if desired)

This completes the initial configuration.

c

A directory will have been made: `/home/opc/.oci`

It will contain the following files:

- `config`
- `oci_api_key.pem`
- `oci_api_key_public.pem`

3. Make a Copy of your `oci_api_key_public.pem` that you will use in your Home OCI User profile's API Keys:

- `[opc@bastion ~]$ cat oci_api_key_public.pem`
- Cut and then Paste this key in the next step

4. Navigate to your OCI Home Console's User Profile to update your User API Keys

- Identity / Security
- Choose Domains
- Choose Default
- Choose Users in left navigation
- Select your User
- Scroll down on left nav to "API Keys" and select
- Select "Add API Key"
- Cut and paste the `oci_api_key_public.pem`
- Select "Add"
- **Note the API key fingerprint. This should be the same fingerprint found in the oci config file: `/home/opc/.oci/config`**

3. Configure the OCI CLI Files

In this section, you will be making changes to the `/.oci/config` file. This file provides the necessary tenancy and security keys for accessing both your Home OCI Region Tenancy as well as your C3 System

- a. `[opc@bastion ~]$ vi ~/.oci/config`
 1. Change the `[DEFAULT]` to `[home]`
 2. Cut and paste the complete section and place beneath it. This will be the section for the C3 Region
 3. Change the second section from `[home]` to `[c3]`

Example:

```
[home]
user=ocid1.user.oc1..aaaaaaaqlnen3dpqyqn6xi6hwl7vuertngidgncd7rbgt2x2ga2rmyawvya
fingerprint=[REDACTED]
key_file=/home/opc/.oci/oci_api_key.pem
tenancy=ocid1.tenancy.oc1..aaaaaaaalmxrgmsqouu26rdybgtwdwtwdwhn7km5oq3u25f6bdpoxihqef6q
region= us-phoenix-1
```

```
[c3]
user=ocid1.user.oc1..aaaaaaaqlnen3dpqyqn6xi6hwl7vuertngidgncd7rbgt2x2ga2rmyawvya
fingerprint=[REDACTED]
key_file=/home/opc/.oci/oci_api_key.pem
tenancy=ocid1.tenancy.oc1..aaaaaaaalmxrgmsqouu26rdybgtwdwtwdwhn7km5oq3u25f6bdpoxihqef6q
region= scasg03.us.oracle.com
```

Note: For your region, simply look at the browser URL, where the console will appear as in this example: <https://console.scasg02.us.oracle.com>. Your region will be scasg02.us.oracle.com

4. For the next step, you will need a Certificate Authority Bundle. The instructions are provided here:
Reference Doc: <https://docs.oracle.com/en/engineered-systems/private-cloud-appliance/3.0-latest/user/user-usr-ce-cli.html#usr-cli-obtain-cabundle>

- a. A summary of the above instructions is provided here
- b. Type into your browser: https://iaas.<your_C3_domain>/cachain

5. Create the c3.pem file

- a. Create a file under the /home/opc/.oci directory and name it "c3.pem"
- b. [opc@bastion /home/opc/.oci~]\$ vi c3.pem
 1. Cut and Paste the Cert File from the previous step and save.

6. Create the oci_cli_rc file

- a. [opc@bastion /home/opc/.oci~]\$ vi oci_cli_rc
- b. Cut and paste and update with your tenancy id :

```
[C3]
tenancy=<your tenancy oid>
cert-bundle=/home/opc/.oci/c3.pem
```

7. Check the CLI access on the OCI Home Region

- a. [bastion /home/opc/.oci]\$ oci os ns get --profile home

```
{
  "data": "axpu7uokzjmj"
}
```

Note: The data output may vary upon your object storage namespace title

8. Next, modify the firewall for CLI access to C3

- a. [bastion /home/opc/.oci]\$ sudo systemctl stop firewalld
- b. [bastion /home/opc/.oci]\$ sudo rm -f /etc/firewalld/direct.xml
- c. [bastion /home/opc/.oci]\$ sudo systemctl start firewalld

9. Confirm CLI access **on C3**

- a. [bastion /home/opc/.oci]\$ oci os ns get --profile c3

```
{
  "data": "axpu7uokzjmj"
}
```

9. Set up a proxy on your bastion host before running the terraform script for systems that do not have direct internet access

- a. [bastion /home/opc/.oci]\$ sudo vi /etc/environment

```
http_proxy=http://www-proxy.<your_domain>.com:80
https_proxy=http://www-proxy.<your_domain>.com:80
no_proxy=localhost,127.0.0.1,1,2,3,4,5,6,7,8,9,0,.<your_domain>.com,.ie.oracle.com,.oraclecorp.com
```

Note: You will need to contact your system administrator for proxy and port settings for your environment.

Terraform Script Execution – Part 1 (Run Script via Home region)

All the Identity related resources, including Dynamic Groups, Policies and Tags, will be created on the OCI Home Region (ie, PHX, IAD, FRA, etc). The OCI Home Region manages the IAM principals for Compute Cloud@Customer. Other resources can be created on Compute Cloud@Customer (C3).

Two Terraform scripts will be run on the bastion server created in previous steps. The first script will be to create the needed Dynamic Group Identity resources on your C3's OCI Home tenancy. The second script will be to create infrastructure resources on C3.

1. SSH into the Bastion Server created in previous steps
 - a. [user@my_laptop ~]\$ ssh opc@<bastion_Private_IP_Address>
2. Make a directory, "openshift"
 - a. [opc@bastion /home/opc]\$ mkdir openshift
3. Make a directory, "createResourceOnHomeRegion" in the openshift directory
 - a. [opc@bastion /home/opc/openshift]\$ mkdir createResourceOnHomeRegion
4. Copy the two files from the following github repo as files into the directory, createResourceOnHomeRegion.
 - a. **REPLACE THIS LINK** <https://github.com/oracle-quickstart/oci-openshift/tree/c3-la/edge/c3> into the directory, **createResourceOnHomeRegion**.
 - b. Replace the variables in [terraform.tfvars](#)
 - c. Replace the default values of "compartment_ocid", "cluster_name" and "home_region_profile_name" (found during OCI CLI Configuration)

```
tenancy_ocid           = "<replace with C3 or PCA tenancy_ocid>"
compartment_ocid      = "<replace with the compartment_ocid>"
home_region_profile_name = "<replace with the oci config profile name of the home region or PCA region>"
cluster_name          = "<replace with the OpenShift cluster name>"
```

Note-1: For home_region_profile_name, this is also used in your /home/opc/.oci/config file. In the example here it is "home" in the first section of config under [home].

5. Before launching the TF scripts, determine if you have tenancy privileges to create Dynamic Groups for specific compartment. **If you do not, please see Step-9 where you will need to ask your OCI System Admin to make these manual updates (alternatively, provide you permissions)**
6. Ensure the environment source for your proxy servers

- a. [opc@bastion createResourceOnHomeRegion~]\$ source /etc/environment
7. Ensure your C3 Certificate is exported
 - a. [opc@bastion createResourceOnHomeRegion~]\$ export custom_cert_location=/home/opc/.oci/c3.pem
 8. Apply the Terraform Script:
 - a. [opc@bastion createResourceOnHomeRegion~]\$ terraform init
 - b. [opc@bastion createResourceOnHomeRegion~]\$ terraform plan
 - c. [opc@bastion createResourceOnHomeRegion~]\$ terraform apply

Note-1: If “**terraform init**” provides an **error** “Failed to query available provider packages”, exit the bastion host and ssh back into the bastion instance.

Note-2: You should witness the following response after terraform apply: Apply complete! Resources: 5 added, 0 changed, 0 destroyed.

9. If you do not have administrative rights to the tenancy in your home region to create Dynamic Groups and Policies. This provisioning will be done manually and at **the tenancy** level:
 - a. **Create a Dynamic Group: “<your-cluster-name>_compute_nodes”**
 1. On the Left Nav, navigate to Identity and Security and choose Domains and the choose Default
 2. On the Left Nav, choose Dynamic Groups and Create a Dynamic Group with the name above.
 3. In the Matching Rules section, copy the following.
 4. Replace the `${var.compartment_ocid}`, in Rule-1, with the target compartment ocid
 5. Replace the `${var.cluster_name}`, in Rule-2, with the target compartment cluster name
 - Rule 1:
 - `instance.compartment.id= '${var.compartment_ocid}'`
 - Rule-2:
 - `tag.openshift- ${var.cluster_name}.instance-role.value='compute'`
 - b. **Create another Dynamic Group: “<your-cluster-name>_control_plane_nodes”**
 1. In the Matching Rules section, copy the following.
 2. Replace the `${var.compartment_ocid}` in Rule-1 with the target compartment ocid
 3. Replace the `${var.cluster_name}` in Rule-2 with the target compartment cluster name
 - Rule 1:
 - `instance.compartment.id= '${var.compartment_ocid}'`
 - Rule-2:
 - `tag.openshift- ${var.cluster_name}.instance-role.value='compute'`
 - c. **Create a Policy** for the control plane nodes in your compartment and name it : “<your-cluster-name>_control_plane_nodes”
 1. In the Policy Builder, using manual editor, copy the following section below and
 1. Replace the `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` with the **control plane DG** name created in the previous step.
 2. Replace the `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` with the target compartment’s **cluster name**

- Allow dynamic-group `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` to manage volume-family in compartment id `c`
 - Allow dynamic-group `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` to manage instance-family in compartment id `${var.compartment_ocid}`
 - Allow dynamic-group `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` to manage security-lists in compartment id `${var.compartment_ocid}`
 - Allow dynamic-group `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` to use virtual-network-family in compartment id `${var.compartment_ocid}`
 - Allow dynamic-group `${oci_identity_dynamic_group.openshift_control_plane_nodes.name}` to manage load-balancers in compartment id `${var.compartment_ocid}`
- d. **Comment out lines 79-107 in the `createlidentityResources.tf` script**
1. This will include:
 1. resource "oci_identity_dynamic_group" "openshift_control_plane_nodes"
 2. resource "oci_identity_policy" "openshift_control_plane_nodes"
 3. resource "oci_identity_dynamic_group" "openshift_compute_nodes"

OpenShift Image Preparation

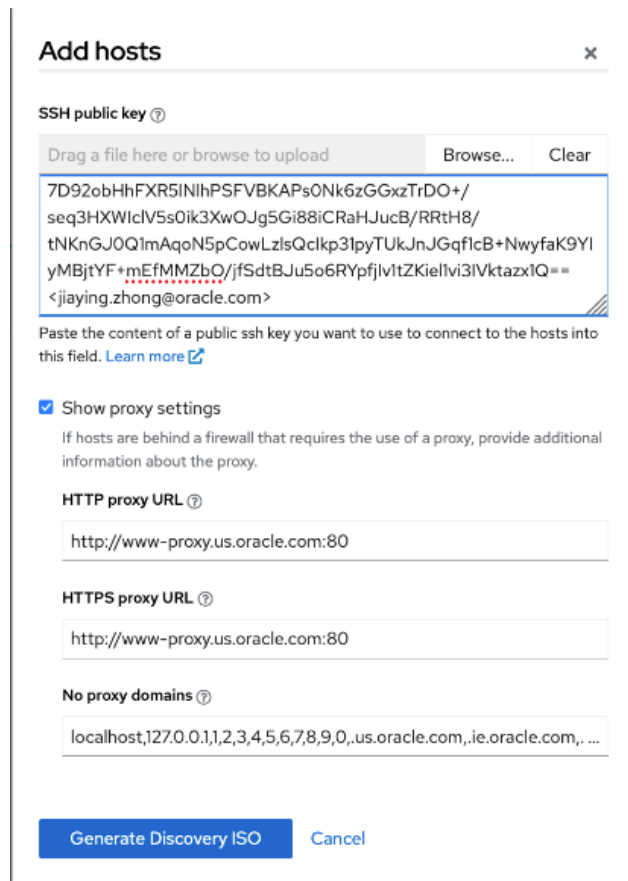

In this section we will generate the OpenShift ISO image on the Redhat Portal, convert it to an OCI compatible image and import it to you C3. This will be done ahead of the second terraform script being executed on your C3 platform.

This can be completed on your laptop and not on the bastion or within environments such as Oracle Solution Center as the resulting image will be uploaded to your C3 platform's custom images in the instructions that follow.

1. Navigate to the Redhat assisted-installer cluster portal: <https://console.redhat.com/openshift/assisted-installer/clusters>
2. **Select** Create New Cluster
3. **On the next page, enter the following:**
 - a. **Cluster name:** The name of your OpenShift cluster. It should be the same as what was specified when creating the resource via Terraform scripts. The `cluster_name` value must be 1-54 characters. It can use lowercase alphanumeric characters or hyphen (-), but must start and end with a lowercase letter or a number.
 - b. **Base domain:** This is the value used for the `zone_dns` variables in Terraform scripts which runs on C3. We will use it in the next section.
 - c. **OpenShift version:** "Openshift 4.16.20"
 - i. **You must use this compatible version.**
 - ii. If you cannot find it directly, go to the bottom of the drop-down menu. Select "show all available versions" and type the version Openshift 4.16.20, then select it. Please use this specific version.
 - d. **"Integrate with external partner platforms":** Select "Oracle Cloud Infrastructure"
 - e. Leave all other values as their defaults. Select "Next"

4. **Under Operators**, do not select any check boxes. Select "Next"
5. **For Host Discovery**, select Add Hosts.
 - a. Add your ssh public key in the window that opens.
 - b. Click the "Show proxy settings" check box, and adding the proxy variables configured in previous steps and is **found in the bastion's /etc/environment** file configured earlier:

```
http_proxy=http://www-proxy.<your_domain>.com:80
https_proxy=http://www-proxy.<your_domain>.com:80
no_proxy=localhost,127.0.0.1,1,2,3,4,5,6,7,8,9,0,.<your_domain>.com
# (ie.oracle.com, .oraclecorp.com)
```

- c. Select Generate Discovery ISO
 - d. Click "Download Discovery ISO". After you have the iso file, you can rename it as you want, for example "discovery_image_<your_cluster_name>.iso".
6. Convert ISO to OCI image, which we will import it to your C3 system from your OCI Home Region Object Store.

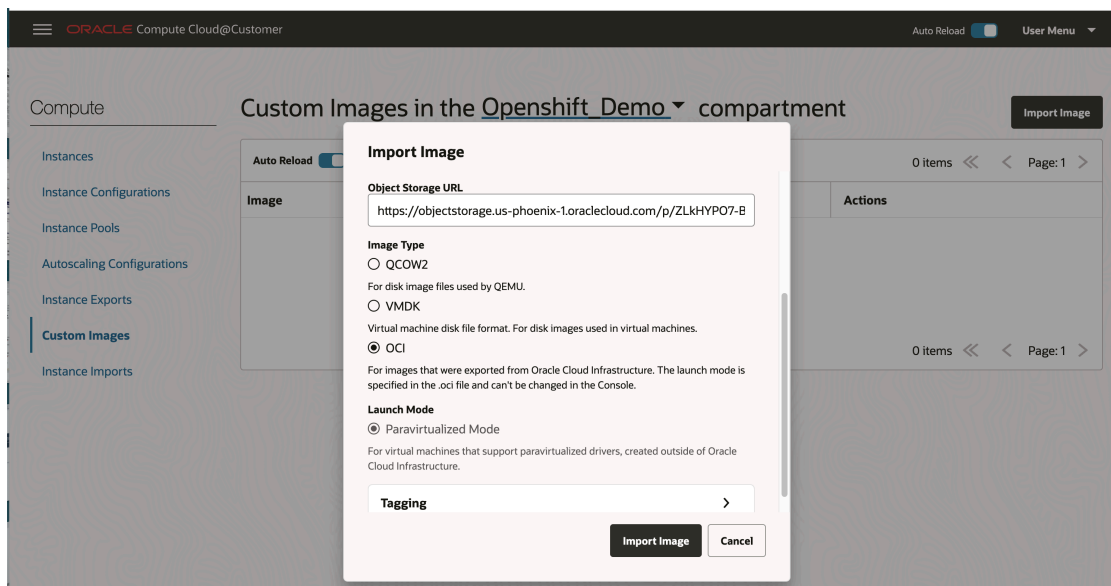

Reference: <https://www.oracle.com/docs/tech/oracle-private-cloud-appliance-x9-2-workload-import.pdf>

- a. Move the downloaded iso image from your /Downloads directory to a new directory to make the following changes

- a. [user@mylaptop ~]\$ mkdir image_prep
- b. [user@mylaptop ~]\$ mv /Downloads/discovery_image_<your_cluster_name>.iso
~/image_prep
- b. Convert the iso to qcow2
 - a. [user@mylaptop ~./imageprep]\$ brew install qemu
 - b. [user@mylaptop ~./imageprep]\$ qemu-img convert -O qcow2
discovery_image_<your_cluster_name>.iso output.QCOW2
- c. Create image_metadata.json as follows (setting FW as UEFI and launch mode as paravirtualized)
 - a. [user@mylaptop ~./imageprep]\$ vi image_metadata.json
 - b. Cut and paste the content below
 - c. Save and quit

```
{
"version": 2,
"externalLaunchOptions": {
"firmware": "UEFI_64",
"networkType": "PARAVIRTUALIZED",
"bootVolumeType": "PARAVIRTUALIZED",
"remoteDataVolumeType": "PARAVIRTUALIZED",
"localDataVolumeType": "PARAVIRTUALIZED",
"launchOptionsSource": "PARAVIRTUALIZED",
"pvAttachmentVersion": 1,
"pvEncryptionInTransitEnabled": false,
"consistentVolumeNamingEnabled": false
},
"imageCapabilityData": null,
"imageCapsFormatVersion": null,
"operatingSystem": "Custom",
"operatingSystemVersion": "Custom"
}
```
 - d. Use the following tar command to combine the metadata image and qcow2 to an .oci file
 - e. [user@mylaptop ~./imageprep]\$ tar cf discovery_image_<your_cluster_name>.oci
image_metadata.json output.QCOW2
7. Upload the "discovery_image_<your_cluster_name>.oci" to an OCI bucket, and generate a Pre-Authenticated Request (PAR) URL
 - a. Log into C3's OCI Home Region's Tenancy
 - b. Navigate to Object Storage & Archive Storage -> Buckets. Select your compartment. Create a bucket.
 - c. Upload the "discovery_image_<your_cluster_name>.oci" to OCI bucket.
 - d. Select the hotdog (dot) menu next to it and **Create Pre-Authenticated Request** for the object, allowing object reads and extending the expiration date to your needs. Copy the PAR URL and keep it. We will use it in the next step.

8. Import OCI image on C3 portal.
 - a. Log into your to C3's Console
 - b. Click Compute → Click custom images (from the pull down) → Select your compartment
 - c. Click import image
 1. → give it a name
 2. → Source Type choose "Import from an Object Storage URL"
 3. → Paste the PAR URL generated in previous step in the "Object Storage URL"
 4. → Image type select "OCI"
 5. → Launch Mode select "Paravirtualized Mode"
 6. → click import image
 - d. After image states become available, **copy the ocid of the image and keep it**. We will use it as input variable "**image_id_manually_created_on_C3**" when running the tf scripts via C3 regions in the next step

Terraform Script Execution – Part 2 (“Run Script via C3 Region”)

In this section, we will create all the infrastructure resources (LB's, VCN's, Instances, etc) on the C3 System.

1. SSH into the Bastion image from your laptop
 - a. `[my_laptop ~]$ ssh opc@<bastion_Private_IP_Address>`
2. **Set your C3 Certificate location – For Authorizations**
 - a. `[opc@bastion ~] export custom_cert_location=/home/opc/.oci/c3.pem`
 - b. Check that the variable is set properly
 - c. `[opc@bastion ~] echo $custom_cert_location`

Note: During the execution of the next TF script, and see an x509 Cert issue, use the command in 2a above to provide Certificate location

3. Make a directory "**createResourceOnC3**" and copy following two files into the directory <https://github.com/oracle-quickstart/oci-openshift/tree/c3-la/edge/c3>.
 - a. Two files to be duplicated:
 1. [createInfraResources.tf](#)
 2. [terraform.tfvars](#)
 - b. [Bastion /home/opc/openshift]\$ mkdir createResourceOnC3
 - c. Update all the variables in the C3 Region's [terraform.tfvars](#) file

```

c3_or_pca_region           = "<replace with C3 region or PCA region>"
compartment_ocid          = "<replace with the compartment_ocid>"
c3_or_pca_region_profile_name = "<replace with the oci config profile name of the C3
region or PCA region>"
cluster_name              = "<replace with the OpenShift cluster name>"
zone_dns                  = "<replace with the name of cluster's DNS zone>"
image_id_manually_created_on_C3 = "<replace with the image ocid which manually created
on C3>"
control_plane_shape       = "<replace with the Compute shape of the control_plane
nodes>"
compute_shape             = "<replace with the Compute shape of the compute
nodes>"
create_openshift_instance_pools = true

```

Note1: The C3 or PCA region is the FQDN of the console you logged into. Following are two examples:

- (1) C3 Lab Console: console.scasg03.us.oracle.com. Region = scasg03.us.oracle.com
- (2) PCA Lab Console: console.scasg02.us.oracle.com Region = scasg02.us.oracle.com

Note2: Compute Shapes

- (1) **For C3, insert and use (for both Control Plane & Compute):** VM.PCAStandard.E5.Flex
- (2) **For PCA, insert and use (for both Control Plane & Compute):** VM.PCAStandard1.Flex

Note3: If you are building multiple different clusters on the C3, you will need to edit the [createInfraResources.tf](#) file. On line 80, "vcn_dns_label", the default should be changed to a random unique name. The default is: "openshiftvcn". Simply change it to "openshiftvcn79", "openshiftvcn,41" etc.

4. Ensure the environment source for your proxy servers
 - a. [opc@bastion createResourceOnHomeRegion~]\$ source /etc/environment
5. Ensure your C3 Certificate is exported
 - a. [opc@bastion createResourceOnHomeRegion~]\$ export

custom_cert_location=/home/opc/.oci/c3.pem

6. Apply the Terraform Script

```

[Bastion createResourceOnC3]$ terraform init
[Bastion createResourceOnC3]$ terraform plan
[Bastion createResourceOnC3]$ terraform apply

```

5. **Record of the Terraform output**, as it will be used it in later steps. Below is a generic example:

```

useInstancePrincipals: true
compartment: <compartment-ocid>

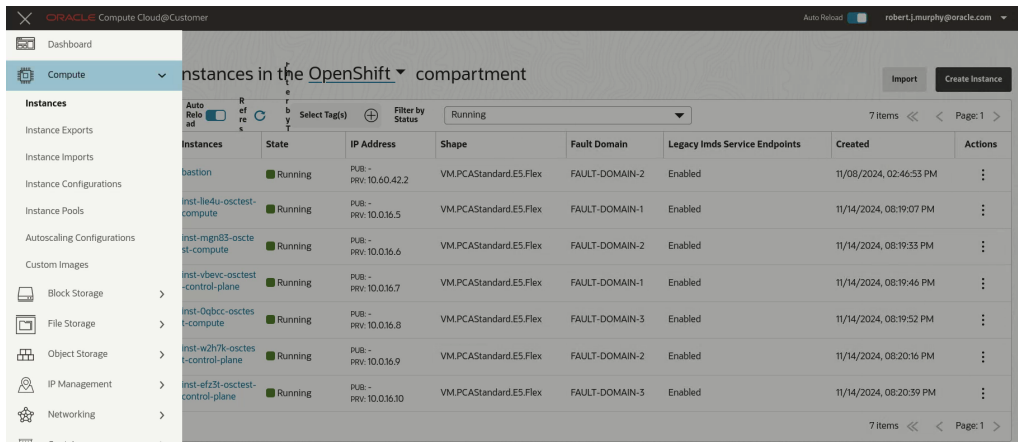

```

```

vcn: <vcn-ocid>
loadBalancer:
  subnet1: <subnet-ocid>
  securityListManagementMode: Frontend
  securityLists:
    <subnet-ocid>: <security-ocid>
rateLimiter:
  rateLimitQPSRead: 20.0
  rateLimitBucketRead: 5
  rateLimitQPSWrite: 20.0
  rateLimitBucketWrite: 5
  
```

6. **3 control plane (CP) nodes and 3 compute worker nodes** : Now running

- a. After you finished above steps, you will have 3 control plane (CP) nodes and 3 compute worker nodes that are up and running.
- b. You can validate this from the C3 console. Click "Compute" and switch to your compartment.
- c. You can distinguish the CP nodes from compute nodes by the suffix in the display name.

7. **Update the defined tags of all the CP and worker nodes:**

- a. Updating the instance tags will need to be done manually by updating the instance tags one by one using OCI CLI commands.
- b. In the bastion instance, run the following OCI CLI command to list all the running instances in your compartment:

```

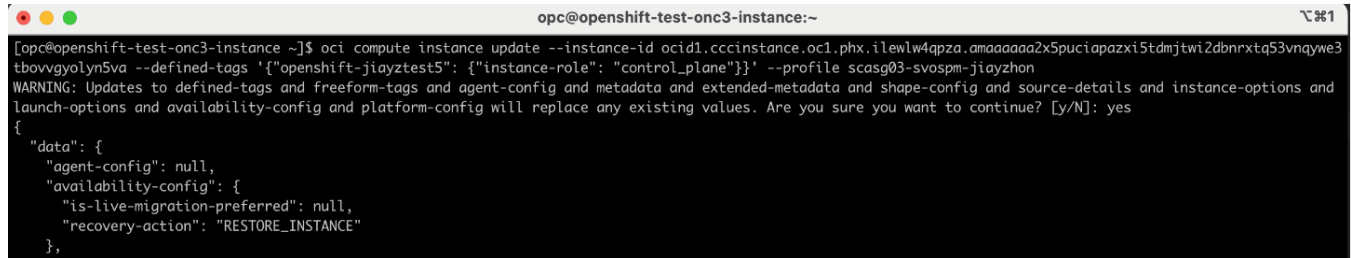

1. [opc@bastion ~]$ oci compute instance list --lifecycle-state RUNNING --compartment-id <your_compartment_id> --profile <your_C3_profile_name>
  
```

Note: <your_C3_profile_name> is found in the config file on your bastion instance: [opc@bastion]\$ /home/opc/.oci/config. In this example, it is "c3".

- b. From the output, capture the ocids of the CP nodes and worker nodes.
- c. Alternatively, obtain each CP and Worker OCIDS from the C3 Console. With all the instances shown, as in Step 6 above, click on the respective instance hotdog menu under Actions and Copy the Instance OCID.

- d. Run following OCI CLI commands one by one to update the defined tags.

Note: The UPDATE tag operation will override the defined tag, (i.e., it will NOT Append the new tags at the end. If you don't want to lose the previous "defined tags", you need to manually capture them and append the Openshift tag at the end manually.

```

opc@openshift-test-onc3-instance:~
[opc@openshift-test-onc3-instance ~]$ oci compute instance update --instance-id ocid1.cccinstance.oc1.phx.ilewlw4qza.amaaaaaa2x5puciapazxi5tdmjtwi2dbnrxtq53vnqywe3
tb0vgyolyn5va --defined-tags '{"openshift-jiayztest5": {"instance-role": "control_plane"}}' --profile scasg03-svospm-jiayzhon
WARNING: Updates to defined-tags and freeform-tags and agent-config and metadata and extended-metadata and shape-config and source-details and instance-options and
launch-options and availability-config and platform-config will replace any existing values. Are you sure you want to continue? [y/N]: yes
{
  "data": {
    "agent-config": null,
    "availability-config": {
      "is-live-migration-preferred": null,
      "recovery-action": "RESTORE_INSTANCE"
    },
  },
}

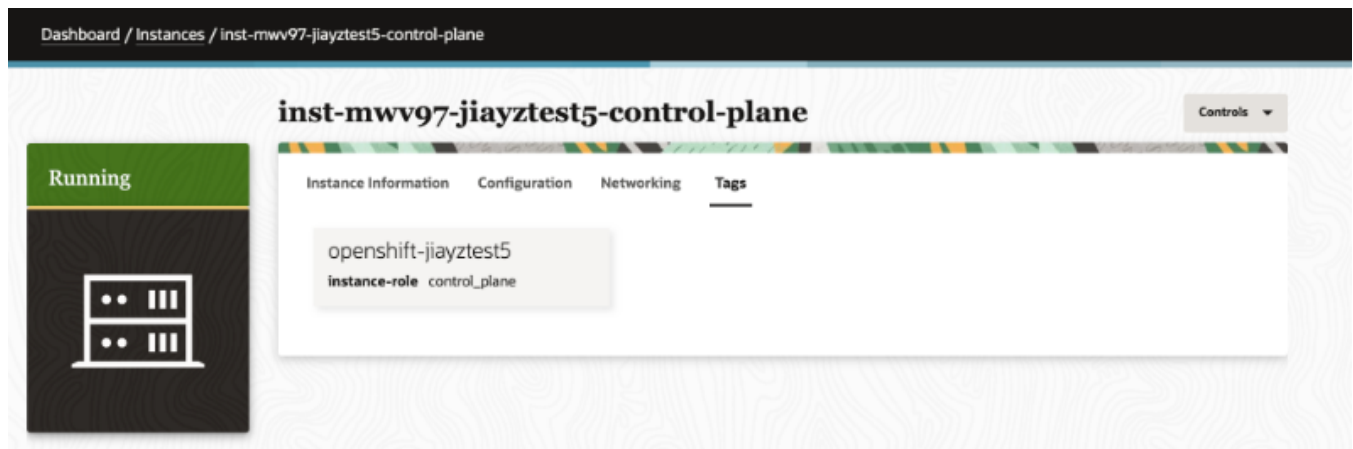

```

8. Updating the Control Plane nodes -

- a. [opc@bastion ~]\$ oci compute instance update --instance-id <CP_instance_ocid_1> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "control_plane"}}' --profile <your_C3_profile_name>
- b. [opc@bastion ~]\$ oci compute instance update --instance-id <CP_instance_ocid_2> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "control_plane"}}' --profile <your_C3_profile_name>
- c. [opc@bastion ~]\$ oci compute instance update --instance-id <CP_instance_ocid_3> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "control_plane"}}' --profile <your_C3_profile_name>

9. Updating the Worker nodes -

- a. [opc@bastion ~]\$ oci compute instance update --instance-id <compute_worker_instance_ocid_1> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "compute"}}' --profile <your_C3_profile_name>
- b. [opc@bastion ~]\$ oci compute instance update --instance-id <compute_worker_instance_ocid_2> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "compute"}}' --profile <your_C3_profile_name>
- c. [opc@bastion ~]\$ oci compute instance update --instance-id <compute_worker_instance_ocid_3> --defined-tags '{"openshift-<your_cluster_name>": {"instance-role": "compute"}}' --profile <your_C3_profile_name>
- d. After updating the tags, you can verify your changes on the C3 console
 - i. Navigate to one of the instances, and click the "Tags"
 - ii. It should have the format of: openshift-<your_cluster_name>

- e. Next, manually "stop" and "start" the instances one by one on the C3 portal. (Batch operations is not currently supported on C3)
 - i. Stop the CP and worker instance.
 - ii. After each instance has "Stopped", click on Start.

Install the Cluster using the RH Assisted Installer UI

Installation of the OpenShift Cluster can now start, where all infrastructure has been configured and instances are running and ready to be registered with Redhat.

1. Go back to the Redhat assisted-installer cluster portal: <https://console.redhat.com/openshift/assisted-installer/clusters>
2. Go to the "Host Discovery" section. If the Terraform scripts have been successful a list of hosts will appear on this page.
3. There should be 12 hosts where 6 of them are disconnected. The cause for this is that we had "restart" the instances on C3 in the above procedures. **These disconnected hosts can be removed**

Host discovery

Add hosts

Run workloads on control plane nodes

Information & Troubleshooting
 Minimum hardware requirements Host not showing up? Check your VM reboot configuration.

Host Inventory

6 selected	Actions	Role	Status	Discovered on	CPU Cores	Memory	Total storage	(13)
<input checked="" type="checkbox"/>	00-13-97-4f-7f-d8	Auto-assign	Disconnected	7/31/2024, 6:37:39 PM	8	16.00 GiB	110 TB

- Following the removal of "disconnected" nodes, all the other nodes indicating "insufficient" status will become "ready" in 2-3 minutes.
- Assign the 3 nodes with a boot size of 1.1TB as the "Control Plane" Role, and 3 nodes with boot size 107GB as "Worker" Roles. Rename the hosts with a name shorter than 63 characters, otherwise the cluster installation will fail.

1. After completing this, select "Next".

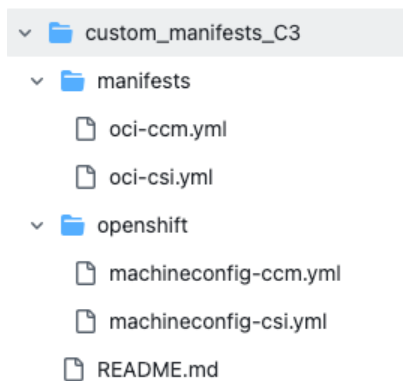

- 5 Networking
- 6 Custom manifests
- 7 Review and create

Minimum hardware requirements Host not showing up? Check your VM reboot configuration.									
Host Inventory									
0 selected	Actions	Hostname	Role	Status	Discovered...	CP...	Me...	Tot...	(7)
<input type="checkbox"/>		cp1	Control plane node	Ready	7/31/2024, 7:29:11 PM	8	16.00 GiB	110 TB

<input type="checkbox"/>		worker2	Worker	Ready	7/31/2024, 7:28:06 PM	8	16.00 GiB	107.37 GB	

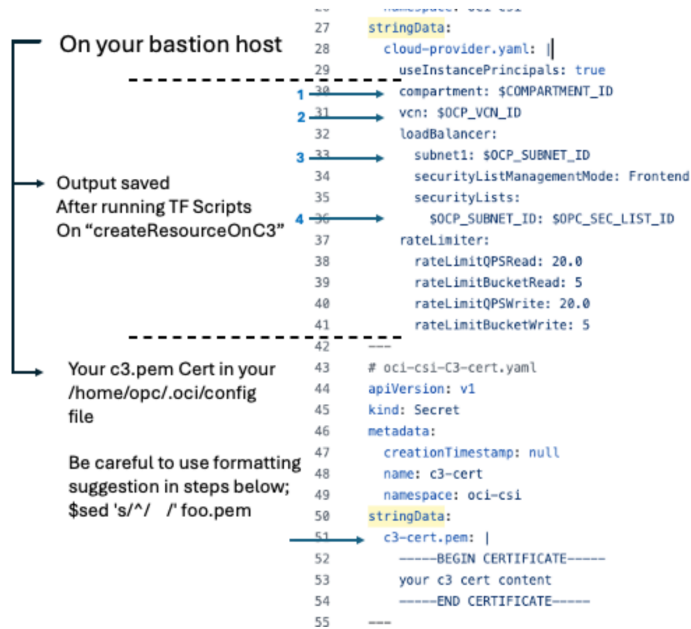

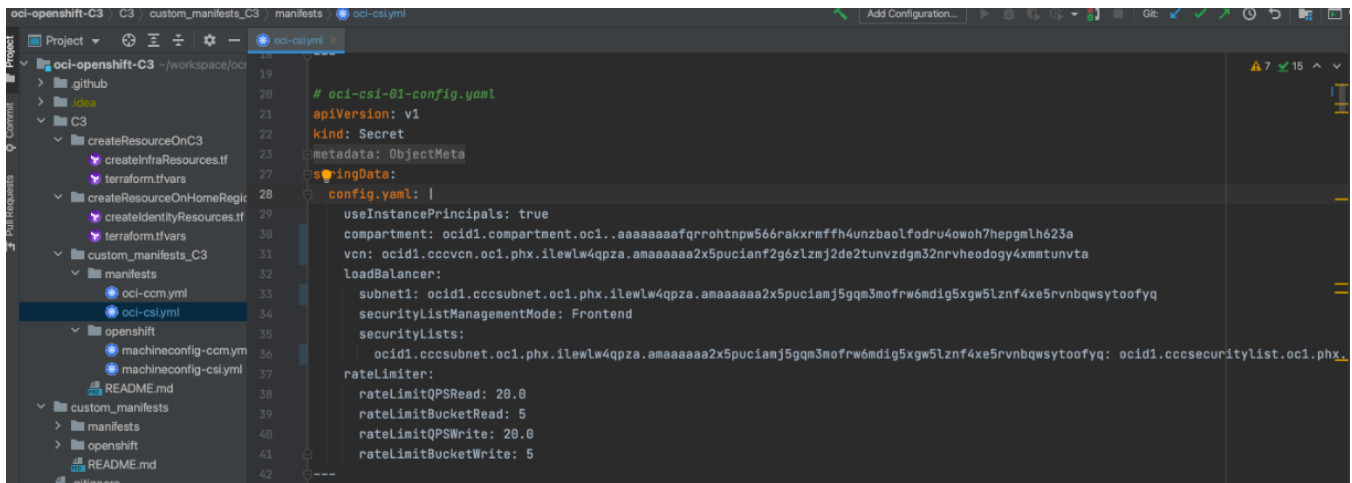

6. **Storage** : No updates will be required for Storage. Select "Next" to Continue
7. **Networking**: you will see "Some validations failed" for each of the hosts. Click the "**Some validations failed**" and click the "Add NTP sources", then **add the IP Address of "169.254.169.254"** for one of the nodes. Then **wait for 2-3 minutes and all the "Some validations failed" indicators shall disappear**. Then continue to **select "Next"**
8. **Custom Manifests**: refer to the manifests files in <https://github.com/oracle-quickstart/oci-openshift/tree/c3-la/edge/c3>

We will be uploading 4 manifests. Use the dropdown to select the appropriate matching title (openshift v. manifests) and **be sure that the file names match**. Two files from OCI should be manifest file type, and the other two from OpenShift should be marked as OpenShift file type.

Create 4 files to in preparation to be uploaded. Copy the respective contents from the github link above. The **machineconfig files DO NOT need to be edited**.

- a. C3/custom_manifests_C3/openshift/
 - i. machineconfig-ccm.yml
 - ii. machineconfig-csi.yml
- b. C3/custom_manifests_C3/manifests/
 - i. oci-csi.yml
 - ii. oci-ccm.yml
- c. **In the oci-csi.yml file:** (found under section b above) , replace the content of **oci-csi-01-config.yaml** section (Line 29-41) with the saved output we obtained from a previous step of "Run Script via C3 region" section above.

- d. In the **oci-csi.yml** file: (found under section b above), replace the content of **oci-csi-C3-cert.yml** section (Lines 52-54) with the content of your C3 Certificate used in previous steps, referred to as "c3.pem" and can be found under [opc@bastion ~]/.oci/c3.pem

Important Note: The formatting of this pem within the two yml files are sensitive to justification.

- To replicate the formatting required for the **oci-ccm.yml** & **oci-csi.yml**, use the following command on your pem file:

```
[opc@test-ssh .oci]$sed 's/^/ /' foo.pem
```

where "foo.pem" is the name of your pem file. the spaces between the two forward slashes is equal to 4 spaces. this is equal to the justification in the two files

The above command will create an output to cut and paste to place in both the **oci-ccm.yml** & **oci-csi.yml** files.

```

```

9. Select "Next".
10. Page: Review and Create.
11. Select "Install cluster".
12. Installation Progress will begin
 - a. It will take approximately 30m to complete

13. Installation Successful

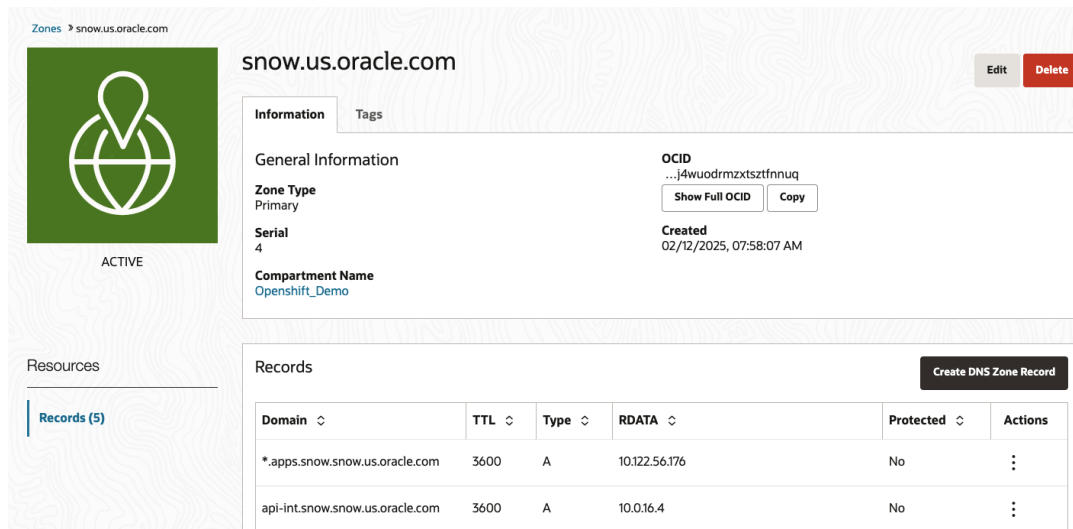

14. This completes the installation

15. To access the OpenShift Console

- a. On the Left Hand Navigation, scroll down to DNS, and choose Zones
- b. Make sure you're in the Compartment of your installed cluster

- c. Click on the DNS Zone Name (in this example: snow.us.oracle.com)
- d. Record the IP Address of the first entry, “*apps.snow.snow.us.oracle.com”. This IP Address will be used to update your /etc/hosts file

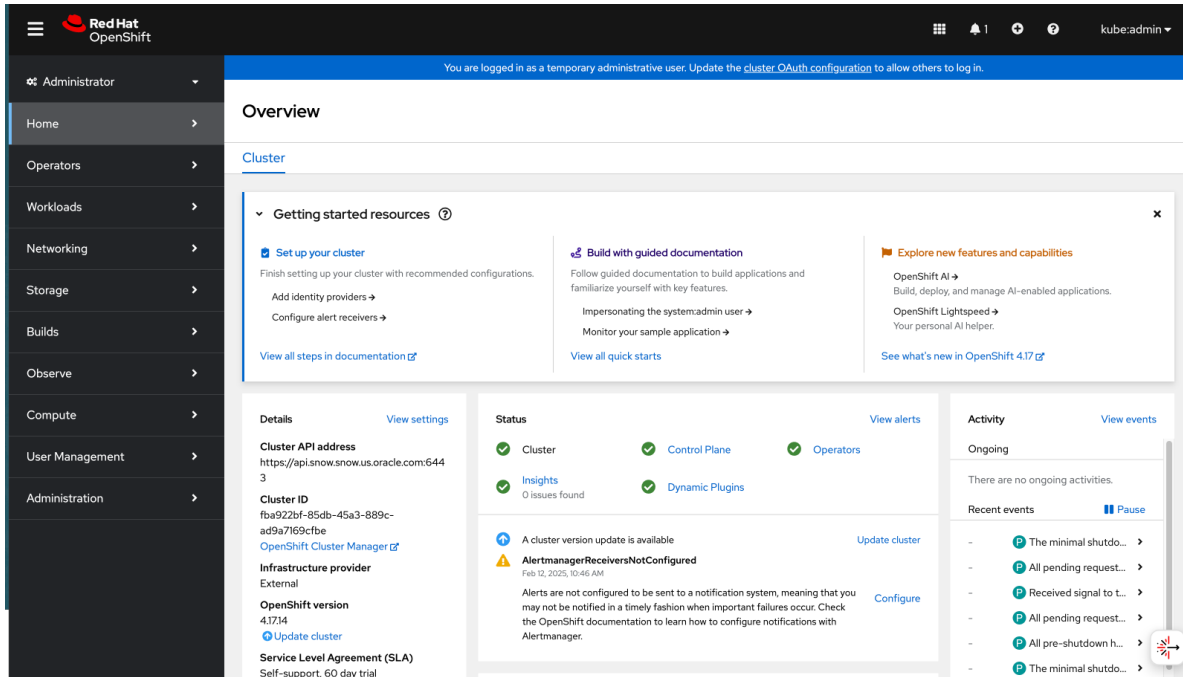

- e. Go to your laptop's terminal, navigate and edit /etc/hosts
- f. Insert a new line with the IP Address obtained in the previous step
- g. After the IP Address, append your specific DNS on to the end
- h. The new line should look like this:

10.122.56.176 console-openshift-console.<your dns entry here > oauth-openshift.<your dns entry here>

Using the above example, it would look like this:

10.122.56.176 console-openshift-console.apps.snow.snow.us.oracle.com oauth-openshift.apps.snow.snow.us.oracle.com

16. You now have access to the OpenShift Portal:

17. This completes the installation.
